#### IBM Cognos Analytics by COUSERA

### 

**Cognos Dashboard Exploration and Interaction** 

#### □ Tools Used:

IBM Cognos Analytics (Cloud Trial), Sample Data

# **6** Objective:

To explore and demonstrate key functionalities of IBM Cognos Analytics by creating interactive dashboards, applying advanced filters, and working with different visualization methods.

# Project Summary:

In this project, I built a multi-tab dashboard using IBM Cognos Analytics, focusing on both automated and manual approaches to creating visualizations. I worked through structured tasks aimed at understanding core features used in real-world business intelligence projects.

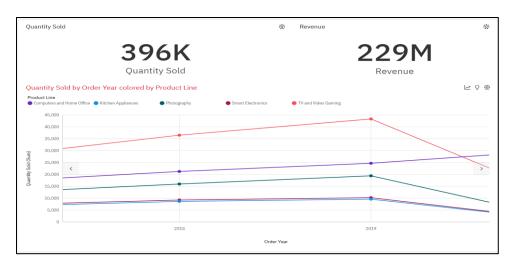

#### **X** Tasks & Features Demonstrated:

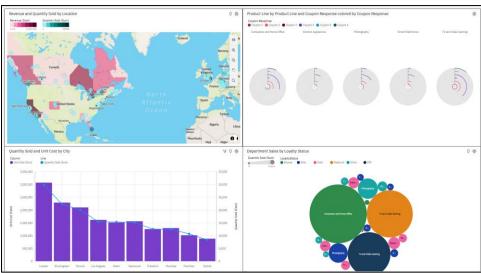

- Tabbed Dashboard Layout:
   Created a dashboard with multiple tabs to organize different types of analysis.
- Visualization Creation Methods:

- Used automatic chart generation for speed and accuracy
- Used the Cognos Assistant (Al assistant) for voice-guided visualization
- Created charts manually for full control over layout and data fields

### Z Data Interaction & Analysis:

- Created Calculations using expression editor to derive new insights
- Kept or excluded specific data points in charts for focused analysis
- Applied Top/Bottom filters to highlight best- or worstperforming entries
- Built and used **navigation paths** for drill-down exploration (e.g., Region → City)
- Applied filters at the tab level to isolate data views for different purposes

# **Q** Key Learnings:

This project helped me understand how to build dynamic dashboards, interact with data visually, and apply business rules through calculated fields. I gained confidence in navigating the Cognos environment and using multiple charting methods to derive insights from sample datasets.

# @ Certification:

Part of the IBM Cognos Analytics on Cloud course on Coursera.
